©2019 MiTek Industries, Inc. All Rights Reserved. #2378-03/2019

## Follow these instructions to ensure the proper installation of MiTek products.

- See current MiTek USP Product Catalog for General Notes, Warranty, and installation information for hanger models, joist sizes, and header situations not shown.
- Loads listed address hanger/header/fastener limitations as well as joist/hanger limitations assuming header material is Douglas Fir-Larch (DF), LVL (SG  $\geq$  0.50) or Spruce-Pine-Fir (S-P-F). Joist reaction should be checked by a qualified designer to ensure proper hanger selection.
- Uplift loads have been increased 60% for wind or seismic loads and no further increase shall be permitted. Reduce loads according to code for normal duration loading such as cantilever construction.
- If hanger height is less than 60% of joist height, joist rotation may occur, therefore supplemental lateral restraints are required, see page 3.
- The type and quantity of fasteners used to install MiTek products is critical to connector performance. To achieve the factored resistances shown in this document, install with the fasteners specified for that particular product. All specified fasteners must be properly installed prior to applying load of any kind to the connection.
- Throughout this document, dimensions are expressed in inches and loads in pounds, unless specifically noted otherwise.
- Load values for 10d and 16d designations in the fastener schedules throughout this document refer to common wire nails, unless noted otherwise.
- The allowable loads shown in this catalog are based on Allowable Stress Design methodology.
- **Multiple Joist Plies:** Fasten together multiple plies of wood I-joists, in accordance with the manufacturer's installation guidelines, such that the joists act as a single unit.
- **Sloped Joists:** Use slope seat hangers and beveled web stiffeners whenever the slope exceeds the following:  $\frac{1}{2}$ :12 for seat bearing lengths of  $2\frac{1}{2}$ " or less;  $\frac{3}{8}$ :12 for bearing lengths between  $2\frac{1}{2}$ " and  $3\frac{1}{2}$ "; and  $\frac{1}{4}$ :12 for bearing lengths in excess of  $3\frac{1}{2}$ ".

**Backer Blocks** – Pattern the nails used to install backer blocks or web stiffeners in wood Joists to avoid splitting the block. The nail pattern should be sufficiently spaced to avoid the same grain line, particularly with solid sawn backer blocks. Backer blocks must be installed on wood Joists

acting as the header, or supporting member. Install in accordance with the I-Joist manufacturer's installation guidelines. The nails used to install hangers mounted to a Joist header must penetrate through the web and into the backer block on the opposite side.

With top flange hangers, backer block required only for downward loads exceeding 250 lbs or for uplift conditions

**Backer Block Installation:**  
Install tight to top flange Use (12) 3" nails, clinched when possible.  
Maximum allowable load for hanger for this detail = 1620 lbs.

**Filler Block Installation:**  
Attach per table to the right. Leave 1/8" gap between top flange and filler block

Backer Block required (only on the loaded side for top-mount hangers)  
(on both sides for face-mount hangers)

**Typical THO (top mount) backer block installation**

**Typical THF (face mount) backer block installation**

### Filler and Backer Block sizes

PKI Flange Width	Backer Block *		Filler Block	
	Thickness (in)	Minimum Depth (in)**	Joist Depth (in)	Filler Block Size (in)
2-1/2	1	5-1/2	9-1/2	2-1/8 to 2-1/4 x 6
			11-7/8	2-1/8 to 2-1/4 x 8
			14	2-1/8 to 2-1/4 x 10
			16	2-1/8 to 2-1/4 x 12
3-1/2	1-1/2	7-1/4	9-1/2	3 x 6
			11-7/8	3 x 8
			14	3 x 10
			16	3 x 12

\* Minimum grade for backer block material shall be Utility grade SPF (south) or better for solid sawn lumber and Rated Sheathing grade for wood structural panels.

\*\* For face-mount hangers, use net joist depth minus 3-1/4" for joist with 1-1/2" thick flanges. For 1-5/16" thick flanges, use net depth minus 2-7/8".

## Web Stiffener Attachment for Joists

PKI Flange Width	Web Stiffener Size Each Side of Web
2-1/2"	1" x 2-5/16" minimum width
3-1/2"	1-1/2" x 2-5/16" minimum width

## Support Height & Lateral Stability

Hangers for joists **without web stiffeners** must support the I-Joist's top flange and provide lateral resistance with less no than 1/8" contact. MiTek recommends that hangers for joist **with web stiffeners** should

be 60% of the joist height for stability during construction. If this cannot be accomplished, potential joist rotation must be resolved by other means.

(Top flange support requirements can be verified in **EWP Top Mount Hangers** charts under the **Web Stiffener Req.** column of **MiTek's USP Product Catalog.**)

## Nailer Installations

### Correct Hanger Attachment to Nail

A nailer or sill plate is considered to be any wood member attached to a steel beam, concrete block wall, concrete stem wall, or other type of support unsuitable for nailing which is used as a nailing surface for top mount hangers to hold beams or joists.

### Nailer Sized Correctly

Top flange of hanger is fully supported and recommended nails have full penetration into nailer, resulting in a carried member hanging safely at the proper height.

The nailer must be sized to fit the support width as shown and be of sufficient thickness to satisfy recommended top flange nailing requirements. A design professional must specify nailer attachment to steel beams.

Avoid direct contact between hangers and steel beams which may cause squeaks

## Wrong Nailer Size Causes Component Failure

### ⚠ Too Narrow

Top flange not fully supported can cause nail breakout. Or, by fully supporting top flange, hanger is tilted back, causing lifting of carried member which results in uneven surfaces and squeaky floors.

### ⚠ Too Wide

Loading can cause cross grain breaking of nailer. The recommended nailer overhang is 1/4" maximum per side.

### ⚠ Too Thin

Top flange nailing cannot fully penetrate nailer, causing reduced allowable loads. Never use hangers which require multiple face nails with a nailer or sill plate since the allowable loads are dependent on all nail holes being used.

## Top Flange Hangers

The thickness of the hanger metal and nail heads on top mount hangers must be evaluated for the effect on subsequent sheathing. Ensure the top mount hanger is installed so the flanges of the hanger are not over-spread which tends to elevate the supported I-Joist, causing uneven floor surfaces and squeaking. Similarly, ensure the hanger is installed plumb such that the face flanges of the hanger are mounted firmly against the wide-face surface of the header.

### ⚠ Hanger over-spread

### ⚠ Hanger not plumb

- 1) Shaded hangers require web stiffeners at joist ends.
- 2) Loads listed are based on hanger attachment to a DF or S-P-F species solid sawn or LVL header. Some loads may be increased for duration of load adjustments. Refer to MiTek USP Product Catalog for details.
- 3) Uplift loads have been increased 60% for wind and seismic loading; no further increase shall be permitted.
- 4) Hangers are special order. Consult MiTek for pricing and lead times.
- 5) Bevel cut required on end of joist to achieve design loads.
- 6) MSH allowable loads listed in this table assume Top-Min mounting condition. For MSH Face-Max and Top-Max mounting conditions not included in this table, refer to the current MiTek USP Product Catalog.
- 7) Flanges on the bucket of the hanger may extend above the top of the joist.
- 8) **NAILS:** 10d nails are 0.148" dia. x 3" long and 16d nails are 0.162" dia. x 3-1/2" long. 16d sinkers are 0.148" dia. x 3-1/4" long and may be used where 10d commons are specified.

# Variable Pitch Connectors - U.S. Allowable Load (Lbs) MiTek®

The TMP and TMPH are designed to make rafter-to-plate connections and eliminate time-consuming bird's-mouth notching or bevel plate installation.

## Installation:

- Use all specified fasteners.
- Position connector on top plate. Fasten connector to outside of top plate with specified nails. Insert rafter into rafter pocket. Adjust rafter and pocket to correct pitch. Fasten rafter to connector with specified nails. For **TMP**: drive nails through the opposing slots in the pocket. For **TMPH**: slide the fulcrum until it supports the pocket at the desired pitch and drive nails down through the fulcrum base into the top plate to lock the fulcrum into position.

<b>PKI 35 plus, 40, 50</b>		<b>Joist Width = 3-1/2"</b>							
All	TMP4	6	10d	4	10d x 1-1/2	1705	250	1705	190

- 1) Web stiffeners may be required for hanger by PinkWood.
- 2) Loads listed are based on hanger attachment to a DF or S-P-F species solid sawn or LVL header. Loads are governed by test results; no further increase shall be permitted.
- 3) Uplift loads have been increased 60% for wind and seismic loading; no further increase shall be permitted.
- 4) **NAILS:** 10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long.

- 1) Web stiffeners are required for all Wood I-Joist installations.
- 2) Loads listed are based on hanger attachment to a DF or S-P-F species solid sawn or LVL header. Loads are governed by test results; no further increase shall be permitted.
- 3) Uplift loads have been increased 60% for wind and seismic loading; no further increase shall be permitted.
- 4) **NAILS:** 10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long.

# Slope/Skew Hangers - U.S. Allowable Load (Lbs)

The LSSH series connects rafters to ridge beams in vaulted roof structures. This series is field adjustable to meet a variety of skew and/or slope applications. Slopes and skews 0° to 45°.

### Installation:

- Use all specified fasteners.

### Steps: (See Figure 1)

1. Position LSSH connector against plumb-cut end of joist. Fasten joist side flanges on both sides with 10d (0.148") x 1-1/2" nails. Bend seat up to fit against joist bottom and drive (1) 10d (0.148") x 1-1/2" nail through bottom seat into joist bottom flange. Drive (2) 10d (0.148") x 1-1/2" nail at downward angle through dimpled nailing guides.
  2. Lean connector and rafter end against ridge beam at desired position. Install 10d (0.148" x 3") or 16d (0.162" x 3-1/2") nails through nail holes into ridge beam at right 90° angle. If skewing the rafter, only drive nails into ridge beam on inside flange.
  3. Bend flange to desired angle.
  4. Hammer outside flange until edge touches header. Fasten outside flange to ridge by driving 10d (0.148" x 3") or 16d (0.162" x 3-1/2") nails through nail holes.
- Web stiffeners are required for all wood I-Joist installations.
  - Designer may consider adding a tension restraint for the supported member for roof slopes exceeding 6/12.

Joist Height	USP Stock No. <sup>1</sup>	Installation Type	Fastener Schedule <sup>5</sup>				DF		S-P-F	
			Header		Joist		Down <sup>2</sup> 100%	Uplift <sup>3</sup> 160%	Down <sup>2</sup> 100%	Uplift <sup>3</sup> 160%
			Qty	Type	Qty	Type				
<b>PKI 10, 20, 23</b>			<b>Joist Width = 2-1/2"</b>							
9-1/2 – 16	LSSH25	Sloped Only	18	16d	12	10d x 1-1/2	2095	945	1640	740
		Skewed Only or Sloped & Skewed	14	16d	12	10d x 1-1/2	1610		1260	
<b>PKI 35 plus, 40, 50</b>			<b>Joist Width = 3-1/2"</b>							
9-1/2 – 16	LSSH35	Sloped Only	18	16d	12	10d x 1-1/2	2645	1310	2345	1020
		Skewed Only or Sloped & Skewed	14	16d	12	10d x 1-1/2	1610		1255	

- 1) Shaded hangers require web stiffeners at joist ends. Web stiffeners may be required for non-shaded hangers by PinkWood.
- 2) Loads listed are based on hanger attachment to a DF or S-P-F species solid sawn or LVL header. Some loads may be increased for duration of load adjustments. Refer to MiTek USP Product Catalog for details.
- 3) Uplift loads have been increased 60% for wind and seismic loading; no further increase shall be permitted.
- 4) Supplemental lateral support connection recommended when hanger height is less than 60% of joist height.
- 5) **NAILS:** 10d x 1-1/2" nails are 0.148" dia. x 1-1/2" long, 16d nails are 0.162" dia. x 3-1/2" long.
